

Path Tracing Analytics

unleashing underlay visibility

Clarence Filsfils, Pablo Camarillo, Ahmed Abdelsalam, **Sonia Ben Ayed**

ECMP Analytics

- Detects
 - Blackholing paths
 - An ECMP path that is not expected (routing/dataplane corruption)
 - Incoherent latency between ECMP paths
- Measures
 - End-to-end latency of each path (60μsec in WAN, 200ns in DC)
- Current technique of sending probes from anywhere to anywhere without any PT data requires AI processing of huge data sets

Demo

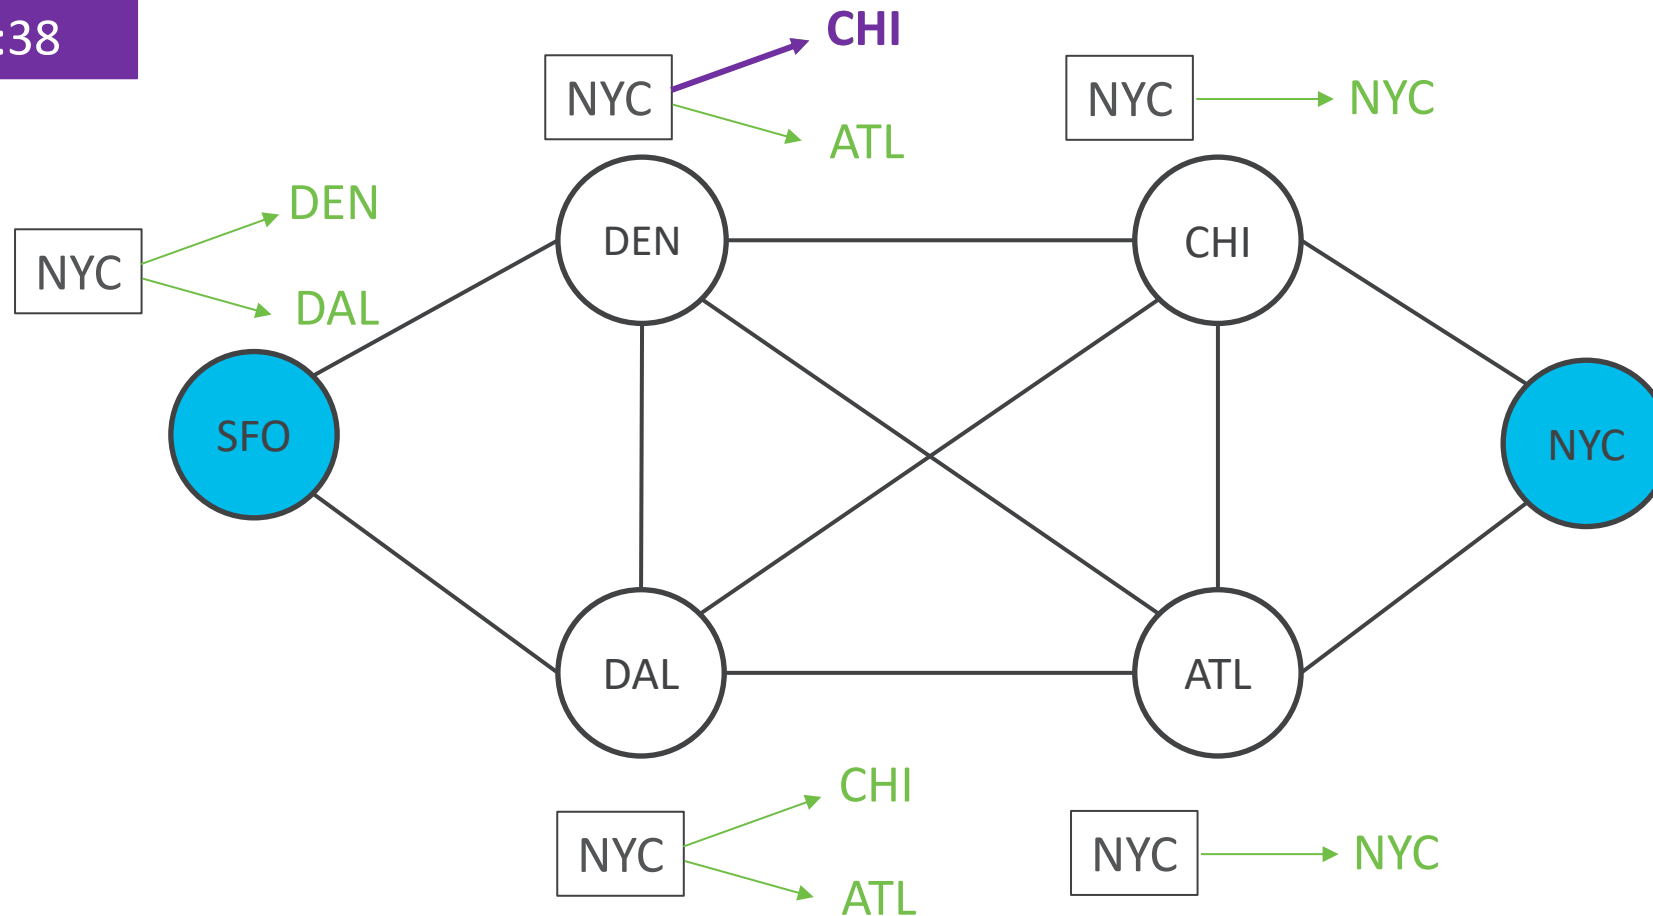

Blackholing Path Detection

Corruption causing blackholes

- Hardware corruption on DEN
 - Traffic to NYC via CHI is dropped.

At 8:38

ECMP Analytics SFO -> NYC

25% of ECMP paths are blackholing.

Last period From/To Time

Blackholes

ECMP non-homogeneous latency

Non-expected forwarding path

Last 1 hour

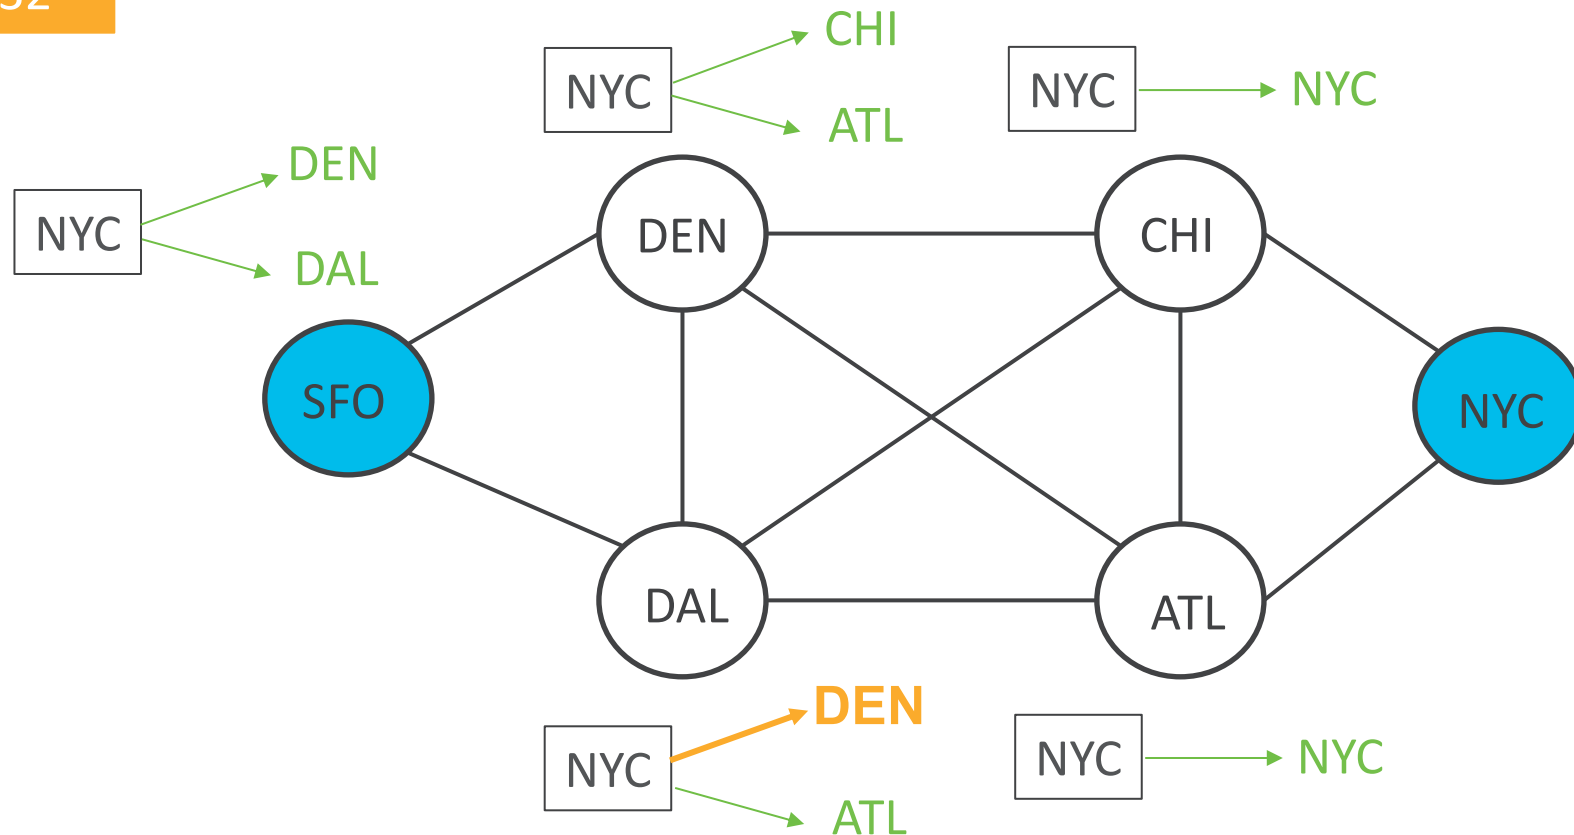

Non-expected/Wrong path Detection

Corruption causing non-expected path

- Hardware/FIB corruption on DAL.
 - Traffic to NYC is taking a wrong path.

At 10:32

ECMP Analytics SFO -> NYC

Last period From/To Time

Last 1 hour

0% (0)
Blackholes

3% (1)
Non-homogeneous latency

17% (5)
Non-expected paths

67% (20)
Good

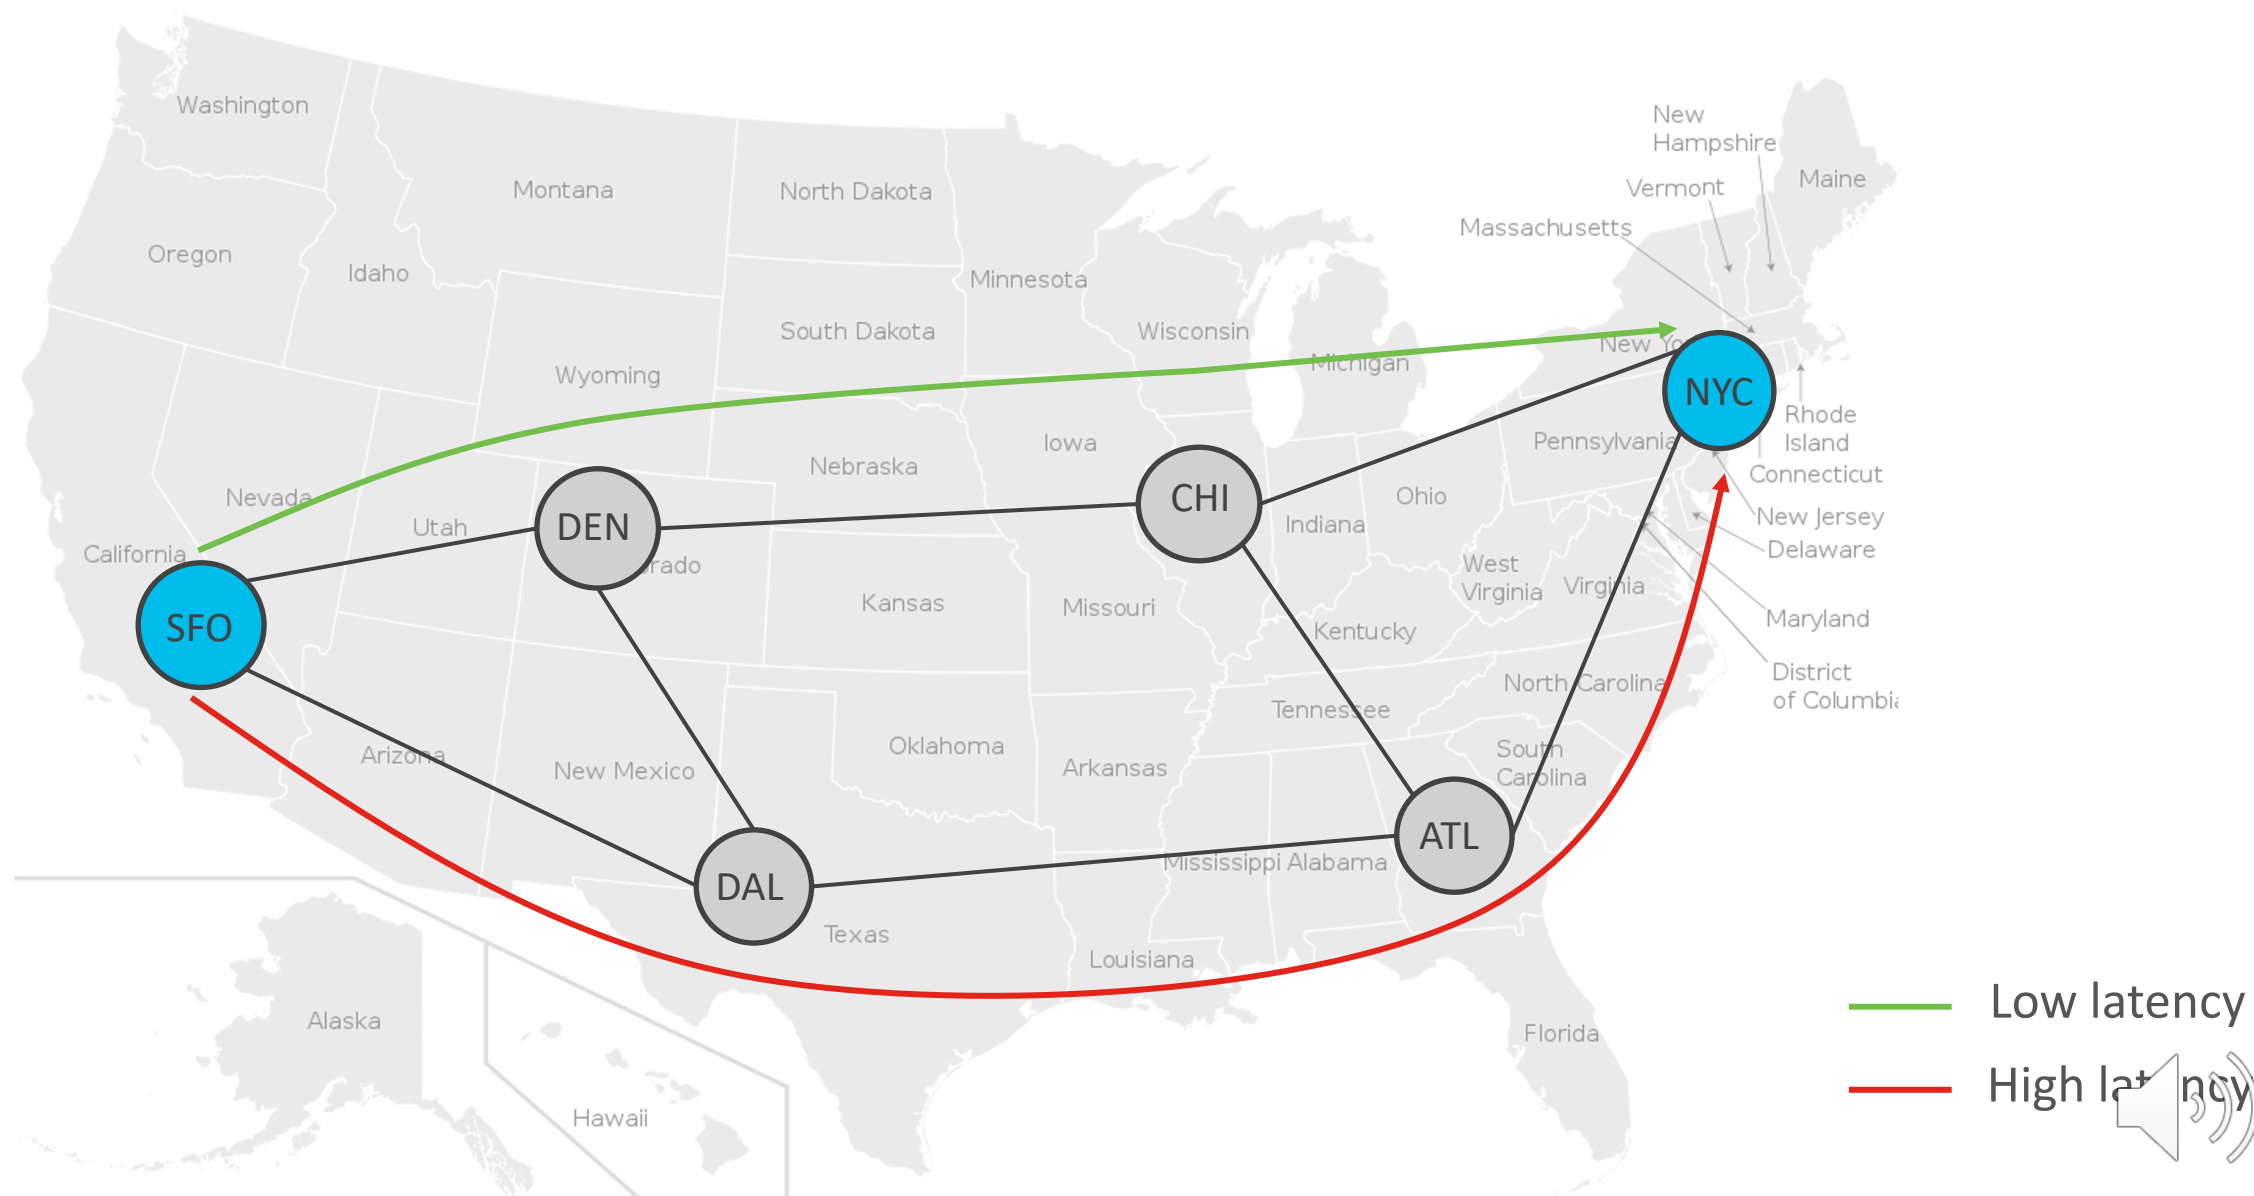

13% (4)
Unmonitored

Blackholes
ECMP non-homogeneous latency
Non-expected forwarding path

Non-homogeneous latency Detection

Corruption causing non-homogeneous latency

ECMP Analytics SFO -> NYC

Last period From/To Time

Last 1 hour

0% (0)

13% (4)
Unmonitored

Blackholes

ECMP non-homogeneous latency

Non-expected forwarding path

Conclusion

- Path Tracing is another innovation solving a 40-year problem
- Significant applicability: transport assurance
 - Latency & Jitter
- Shipping and in deployment
- Rich Eco-System
 - Opensource implementations available
- Path Tracing Analytics :
 - Many use-cases
 - ECMP demo ready

The bridge to possible
